Exercise Solution Part

Table of contents

Exercise 4.1.1:

```
#define __MINMAX_DEFINED  // use STL's generic min and max templates

#include "vector.h"       // include STL vector implementation

#include <iostream.h>

void main (void)
{

  vector<int> v(5);             // define a vector of int and
                                // reserve memory for five elements

  for (int i = 0; i < 5; i++)

        v[i] = 2*i;                 // store arbitrary values into v[0] to v[4]

  cout << "Five values stored in a vector are written to cout:" << endl;

  for (i = 0; i < 5; i++)

        cout << v[i] << "  ";       // print values to cout

  cout << endl;

  // of course you can also use iterators

  // define an iterator to the first vector element
  vector<int>::iterator first = v.begin();
  // define an iterator past the last vector element
  vector<int>::iterator last  = v.end();

  cout << "Now the output loop works with iterators:" << endl;

  while (first != last)

        cout << *first++ << "  ";    // first the iterator is dereferenced,
                                    // then it is incremented
}
```

Exercise 4.1.2:

```
#define __MINMAX_DEFINED  // use STL's generic min and max templates

#include "list.h"         // include STL-list implementation

#include <iostream.h>

void main (void)
{

  list<int> bit_seq;            // define a list of int
  int input = 0;                // value read from cin
  int count_1 = 0;              // counter for number of 1's

  cout << "Insert values 0 and 1, another value to stop input..." << endl;

  while (cin >> input) {

        if (!(input == 0 || input == 1)) break;
        bit_seq.push_back (input);            // list member function push_back
  }

  // create a new list for bit_stuffing
```

```
  list<int> bit_stuffed_seq (bit_seq);

  // define loop iterators
  list<int>::iterator first = bit_stuffed_seq.begin();
  list<int>::iterator last  = bit_stuffed_seq.end();

  // bit stuff loop

  while (first != last) {

                    if (*first == 0)
                                  count_1 = 0;       // reset 1's-counter
                    else if (*first == 1)
                                  count_1++;         // increment number of
                                                    //  consecutive 1's

                    first++;                         // go to the next list element

                    if (count_1 == 5) {
                                        // insert a 0 after the fifth consecutive 1

                      bit_stuffed_seq.insert (first, 0);
                      count_1 = 0;                          // reset counter
                    }
  }

}
```

Exercise 4.1.3:

```
#define __MINMAX_DEFINED  // use STL's generic min and max templates

#include "list.h"         // include STL-list implementation

#include <iostream.h>

void main (void)
{

  list<int> bit_seq;            // define a list of int
  int input = 0;                // value read from cin
  int count_1 = 0;              // counter for number of 1's

  cout << "Insert values 0 and 1, another value to stop input..." << endl;

  while (cin >> input) {

        if (!(input == 0 || input == 1)) break;
        bit_seq.push_back (input);             // list member function push_back
  }

  // output loop

  cout << "Original bit sequence:" << endl;

  // define an iterator to the first list element
  list<int>::iterator first = bit_seq.begin();

  // define an iterator past(!) the last list element
  list<int>::iterator last  = bit_seq.end();

  while (first != last)

               cout << *first++;       // dereference iterator to get value
                                       // then increment iterator
  cout << endl;

  // create a new list for bit_stuffing
  list<int> bit_stuffed_seq (bit_seq);

  // define loop iterators
  first = bit_stuffed_seq.begin();
```

```
  last  = bit_stuffed_seq.end();

  // bit stuff loop

  while (first != last) {

                    if (*first == 0)
                                count_1 = 0;       // reset 1's-counter
                    else if (*first == 1)
                                count_1++;         // increment number of
                                                  //  consecutive 1's

                    first++;                       // go to the next list element

                    if (count_1 == 5) {
                                       // insert a 0 after the fifth consecutive 1

                      bit_stuffed_seq.insert (first, 0);
                      count_1 = 0;                          // reset counter
                    }
  }

  // output loop

  cout << "Bit-stuffed bit sequence:" << endl;

  first = bit_stuffed_seq.begin();
  last  = bit_stuffed_seq.end();

  while (first != last)

               cout << *first++;       // dereference iterator to get value
                                       // then increment iterator
  cout << endl;
}
```

Exercises 4.1.4 and 4.1.5:

```
#define __MINMAX_DEFINED  // use STL's generic min and max templates

#include "list.h"         // include STL-list implementation

#include <iostream.h>

// Since the output loop is often used, we can form a template function
// which does the job.

template <class InputIterator>
void copy_to_cout (InputIterator first, InputIterator last) {

  while (first != last) cout << *first++;

  cout << endl;
}

// The template class "InputIterator" gets a meaning when you study
// chapter 4.2 in iterators.

void main (void)
{

  list<int> bit_seq;            // define a list of int
  int input = 0;                // value read from cin
  int count_1 = 0;              // counter for number of 1's

  cout << "Insert values 0 and 1, another value to stop input..." << endl;

  while (cin >> input) {

        if (!(input == 0 || input == 1)) break;
        bit_seq.push_back (input);             // list member function push_back
  }
```

```
// output loop

cout << "Original bit sequence:" << endl;

copy_to_cout (bit_seq.begin(), bit_seq.end());

// create a new list for bit_stuffing
list<int> bit_stuffed_seq (bit_seq);

// define loop iterators
list<int>::iterator first = bit_stuffed_seq.begin();
list<int>::iterator last  = bit_stuffed_seq.end();

// bit stuff loop

while (first != last) {

                  if (*first == 0)
                                count_1 = 0;       // reset 1's-counter
                  else if (*first == 1)
                                count_1++;         // increment number of
                                                  //  consecutive 1's

                  first++;                         // go to the next list element

                  if (count_1 == 5) {
                                    // insert a 0 after the fifth consecutive 1

                    bit_stuffed_seq.insert (first, 0);
                    count_1 = 0;                          // reset counter
                  }
}

// output loop

cout << "Bit-stuffed bit sequence:" << endl;

copy_to_cout (bit_stuffed_seq.begin(), bit_stuffed_seq.end());

double rel_exp;               // relative expansion (in percent)

rel_exp = (double) bit_stuffed_seq.size() / bit_seq.size();
rel_exp = (rel_exp - 1) * 100;

cout.precision (4);
cout << "Relative expansion: " << rel_exp << "%" << endl;
cout << "Absolute expansion: " << (bit_stuffed_seq.size()-bit_seq.size());
cout << " bit" << endl;

// bit unstuff loop

first = bit_stuffed_seq.begin();
last  = bit_stuffed_seq.end();
list<int>::iterator erase_it;    // used because the erase-iterator
                                 // gets invalid
count_1 = 0;

while (first != last) {

           if (*first == 0) count_1 = 0; else count_1++;

           if (count_1 == 5) {

                  erase_it = first;
                  if (*(++erase_it) != 0) {        // error in input bit sequence
                    cout << "not a valid bit-stuffed sequence!" << endl;
                    exit(0);
                  }
                  bit_stuffed_seq.erase (erase_it);       // erase zero
                  count_1 = 0;
           }
```

```
            ++first;
  }

  cout << "After bit-unstuffing: ";

  // check for success (using operator==)

  bit_stuffed_seq == bit_seq ?  cout << "sequences are equal" :  \
                                cout << "sequences are not equal";
  cout << endl;
}
```

Exercise 4.2.1:

Only the important code pieces are presented:

```
#include <fstream.h>

// read original bit sequence from file bit_seq
ifstream in_file("bit_seq");

copy (istream_iterator<int, ptrdiff_t> (in_file),
      istream_iterator<int, ptrdiff_t> (), back_inserter (bit_seq) );

// store bit stuffed sequence in file bit_stff
ofstream out_file("bit_stff");

copy (bit_stuffed_seq.begin(), bit_stuffed_seq.end(),
      ostream_iterator<int> (out_file, " ") );
```

Exercise 4.3.1:

```
#define __MINMAX_DEFINED  // use STL's generic min and max templates

#include "vector.h"       // include STL vector implementation
#include "algo.h"         // include STL algorithm implementations

#include <iostream.h>

void main (void)
{

  vector<int> a;
  vector<int> b;

  for (int i = 0; i < 4; i++) {a.push_back (i*2); b.push_back ((i+1)*3); }

  vector<int> c(4); // allocate memory for 4 int values!!

  // use the algo "transform" and the function object "plus"
  // transfrom takes the elements of vectors a and b, adds them using
  // plus and writes the results to c
  transform  (a.begin(), a.end(), b.begin(), c.begin(), plus<int>() );

  copy (c.begin(), c.end(), ostream_iterator<int> (cout, " ") );
}
```

Exercise 4.3.2:

```
#define __MINMAX_DEFINED  // use STL's generic min and max templates

#include "vector.h"       // include STL vector implementation
#include "algo.h"         // include STL algorithm implementations

#include <iostream.h>

template <class value_type>
class gen {
      public:
```

```
            gen() : start(0), step(1) {}
            gen (value_type sta, value_type ste) : start(sta), step(ste) {}
            value_type operator() (void)
              { value_type tmp = start; start += step; return tmp; }
      private:
            value_type   start, step;
};

void main (void)
{

  vector<int> v(10);

  generate (v.begin(), v.end(),
            gen<vector<int>::value_type> (1, 2) );

  copy (v.begin(), v.end(), ostream_iterator<int> (cout, " ") );

}
```
